Unisys Data Exchange

Product Information Sheet

Business process integration and decision support simplified

Data: Here. There. Everywhere.

It's a data-driven world. You're producing, sharing and storing more of it than ever before. It's fueling countless business transactions. And the data created by one business process must now be shared with others.

This makes data management a significantly complex endeavor, especially when you're under pressure to turn raw data into an actionable asset. Fortunately, you have a solution to make it easier.

Taming data growth

A data integration solution for ClearPath Forward® MCP and OS 2200 systems, Unisys Data Exchange enables selective and near-real-time data replication and transformation from a source data store to one or more target data stores.

It can propagate a selected set of data across data stores and, while doing so, apply transformations that help you support business process integration, reporting, big data analytics and business intelligence activities.

Making data work for you

With Unisys Data Exchange, you can:

- **Increase operational efficiency:** By automatically capturing updates to source data stores as they occur and replacing batch data transfers, Unisys Data Exchange enables you to provide better service, effectively integrate and automate business processes and make faster decisions.
- **Reduce software development and maintenance costs:** Unisys Data Exchange can help you minimize the costs associated with developing, testing and supporting your data integration and transformation tools.
- **Minimize overhead:** The ability to share a subset of your source data with the target data store helps reduce costs while making it easier to support changing business objectives.
- **Increase IT flexibility:** Because it supports the integration of heterogeneous data sources running on multiple operating systems, Unisys Data Exchange breaks down data silos and helps IT innovate with greater ease and efficiency.
